

Nithish Kumar

Cloud Operations Engineer & SRE-Focused Software Engineer

✉ nithish21kumar04@gmail.com | ☎ +353 089 985 3696 | 📍 Dublin

SUMMARY

Cloud Operations-focused Software Engineer with 3+ years of experience operating secure, scalable, and high-performing cloud-hosted systems for customer-facing workloads in the information technology and technology industries. Hands-on with Linux system administration, server administration, monitoring, incident management, and performance troubleshooting across AWS, Azure, GCP, and Google Cloud environments, using tools such as Docker, Kubernetes (EKS), CloudWatch, Splunk, and CI/CD pipelines. Strong programming background in Java, JavaScript/TypeScript, Python, SQL, and Go, with experience across programming languages and software development for backend services, automation scripts, and troubleshooting utilities in web services and internet technologies. Experienced in collecting and analysing system performance data, tracing incidents, automating routine operational tasks, documenting SOPs and troubleshooting workflows, and collaborating with global engineering, product management, and support teams to reduce mean time to resolve incidents and improve uptime. Motivated by the opportunity to innovate in a 24/7 cloud operations environment, contribute to Atlas-style database operations, support a global office working model in Cork, and bring a professional commitment to reliability, escalation management, and customer impact.

EXPERIENCE

Jabil

May 2025 – Present

Support Engineer (Cloud Operations & SRE)

Dublin, Ireland

- Coordinate and collaborate with a global teaming engineering and operations team responsible for the uptime and reliability of cloud-hosted, Linux-based services, contributing directly to availability targets and operational SLAs for customer base workloads.
- Monitor application health through dashboards, metrics, and logs; detect emerging outage and customer facing incidents, triage alerts, and assist in proactive incident resolution for distributed microservices.
- Diagnose live incidents across Linux services, distributed microservices, and TCP/IP networking, distinguishing platform issues from integration or usage issues, and taking the next steps toward resolution.
- Designed and optimised core data structures and service logic for high-concurrency workloads, reducing average request latency by 25% and contributing to lower mean time to resolve performance-related incidents.
- Built comprehensive automated regression and functional test suites for critical features, improving release quality and reducing defect escape rates by 40% over multiple sprints.
- Coordinated configuration management and deployments across Dev, Test, and Production using CI/CD pipelines in Azure and AWS, improving deployment consistency and reducing rollback frequency by 20%.
- Performed system performance data collection and analysis using metrics, logs, and trend reports, identifying hotspots and feeding recommendations into architecture and configuration improvements.
- Assisted in post-incident root cause analysis (RCA) by consolidating timelines, reviewing logs and metrics, and helping identify process or workflow breakdowns and preventive changes.
- Maintained and extended operational documentation, including runbooks, SOPs, corner-case troubleshooting workflows, and architecture diagrams, strengthening team knowledge and speeding up incident resolution.
- Developed internal support tooling and backend utilities in Golang to automate diagnostics and routine troubleshooting tasks, reducing manual investigation time by 35%.
- Worked closely with product, cloud engineering, and support partners to highlight areas for improvement in the management applications and operational processes supporting production services.
- Participated in Agile ceremonies and regular operational reviews, providing status updates on incidents, risks, and ongoing reliability initiatives, and preparing to participate in on-call rotations as the team scales.

Rapid Data Technologies Pvt Ltd

August 2020 – October 2023

Associate Software Engineer (Backend & Cloud Services)

India

- Engineered backend services and RESTful APIs using Java Spring Boot and Node.js on AWS, backed by MongoDB, PostgreSQL, MySQL, Oracle IMS/RMS, and DynamoDB to support enterprise financial and operational workflows.
- Delivered 15+ production APIs that improved system efficiency by approximately 10% and reduced response times by around 15% through performance-focused design, query optimisation, and caching strategies.
- Architected real-time, event-driven messaging pipelines using AWS Lambda, SQS, and Kafka to process asynchronous workloads, providing a resilient foundation for high-volume, cloud-native services.
- Implemented database operations tasks such as schema design, index tuning, and data migration for relational and NoSQL systems, strengthening data reliability and query performance.
- Built web and integration tools that exposed operational and reporting data to internal stakeholders, helping teams visualise and analyse system behaviour and performance.
- Containerised applications using Docker and deployed them on Kubernetes (AWS EKS), improving environment consistency by 40% and enabling more reliable deployment and scaling models.
- Automated build, test, and deployment processes using Jenkins and GitHub Actions, reducing release cycle time and improving delivery predictability and reliability.
- Applied clean code and object-oriented design practices with Git-based workflows, code reviews, unit tests (JUnit), UI tests (Selenium), and regression suites, reducing regressions by 30%.
- Participated in incident response and production support for customer facing environments, collaborating with operations teams to troubleshoot issues, analyse logs, and implement fixes across application and database system layers.
- Contributed to Agile/Scrum ceremonies (backlog refinement, estimation, sprint planning, stand-ups, retrospectives), translating business needs into technical tasks and prioritising work based on customer base impact.

EDUCATION

Maynooth University

December 2024

Computer Science (Software Engineering), Master of Science

S.A.E.C (Anna University)

December 2021

Computer Science, Bachelor of Engineering

SKILLS

- **Cloud Operations & SRE:** Cloud operations, DevOps/SRE practices, incident management, production support, on-call readiness, monitoring and alerting, system performance data collection and analysis, capacity and reliability considerations, MTTR reduction, root cause analysis (RCA)
- **Operating Systems & Networking:** Linux system administration (Linux-based services, configuration, troubleshooting), Windows enterprise environments, DNS, TCP/IP networking, load balancing basics, web and internet technologies
- **Programming & Scripting:** Java, JavaScript, TypeScript, Python, Go (Golang utilities), SQL, C++ exposure, Automation scripts and small tools for monitoring, diagnostics, and data processing (primarily in Go, Python, and Java)
- **Backend & APIs:** Java Spring Boot, Node.js, FastAPI, RESTful API design and integration, GraphQL, microservices, event-driven architectures using Kafka and AWS SQS, service-oriented architectures
- **Databases & Data:** MongoDB, PostgreSQL, MySQL, Oracle IMS/RMS, DynamoDB, SQL and NoSQL data modelling, query optimisation, database operations concepts, supporting financial and operational data workflows
- **Cloud Platforms & Infrastructure:** AWS (Lambda, API Gateway, SQS, SNS, Batch, EC2, EKS, ECS, S3, Step Functions, Parameter Store, EFS), Azure exposure, Docker, Kubernetes (AWS EKS), cloud-native deployments, distributed messaging, serverless/FaaS concepts
- **Monitoring, Observability & Tooling:** Monitoring dashboards, CloudWatch metrics and logs, logging and alerting patterns, performance diagnostics via logs and metrics, basic JVM troubleshooting, Git, GitHub, Jenkins, GitHub Actions, Jira, ServiceNow

- **Processes & Collaboration:** Agile/Scrum, cross-team collaboration with product, engineering, and support, technical documentation (runbooks, SOPs, architecture notes), knowledge sharing, continuous improvement, keen interest in learning new technologies

PROJECTS

Omni – AI Digital Memory App (MVP)

- Developed an MVP digital memory application using Retrieval-Augmented Generation (RAG) to store user documents, extract insights, and answer questions with grounded responses, backed by scalable backend services and database storage.
- Implemented backend APIs, data flows, and basic monitoring to support reliable search and query operations while ensuring secure data handling and responsive user interactions.

Extracting Musical Notes API – Python & FastAPI

- Built a FastAPI-based REST service in Python to process audio files and select the most effective algorithmic approach for extracting musical notes, designing the service to be easily monitored, tested, and integrated.
- Refactored the core logic into a reusable Python library and published it on PyPI, demonstrating the ability to package operational components for reuse and integration in other systems.

Incident Management System – Java Spring Boot & MySQL

- Created a Java Spring Boot application integrating PagerDuty and ServiceNow APIs to merge and transform incident data based on business rules and store it in MySQL.
- Automated manual incident reporting, enabling faster and more accurate operational analysis and contributing to better incident management practices.

SAMS – Simple Async Messaging Services (AWS Serverless)

- Implemented an asynchronous messaging platform using AWS SQS, Lambda, EventBridge, API Gateway, and SNS to simplify and scale communication between microservices in distributed systems.
- Improved decoupling, resilience, and cost efficiency of interservice communication, aligning with modern cloud operations principles.

CERTIFICATES

- Specialization in AWS Serverless Architecture.
- VMware Network Virtualization Concepts.
- AWS DevOps Crash Course.
- Backend Development with Node.js.
